Total Mark : 10
Marks Obtained : 10

Section 1 : COD

1. Problem Statement

John is organizing a fruit festival, and the quantities of various fruits are stored in a HashMap where fruit names are keys and quantities are values.

Help him develop a program to find the total quantity of fruits for the festival by summing up the values in the HashMap.

Input Format

The input consists of fruit quantities in the format 'fruitName:quantity', where fruitName is the name of the fruit(a string), and quantity is a double value representing the quantity.

The input is terminated by entering "done".

Output Format

The output prints a double value, representing the sum of values in the HashMap, rounded off to two decimal places.

If the value is not numeric, print "Invalid input".

If any special characters other than ':' are entered, print "Invalid format".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: Banana:15.2

Orange:56.3

Mango:47.3

done

Output: 118.80

Answer

// You are using Java

import java.util.*;

import java.text.DecimalFormat;

```
interface FruitOperations {  
    void addFruit(String fruitData);  
    double getTotalQuantity();  
}
```

```
class FruitFestival implements FruitOperations {  
    HashMap<String, Double> fruits = new HashMap<>();  
    boolean invalidInput = false;  
    boolean invalidFormat = false;
```

```
    public void addFruit(String fruitData) {  
        if (!fruitData.contains(":")) {  
            invalidFormat = true;  
            return;  
        }  
    }
```

```
    String[] parts = fruitData.split(":");  
    if (parts.length != 2) {
```

```

        invalidFormat = true;
        return;
    }

    String fruitName = parts[0];
    String quantityStr = parts[1];

    try {
        double quantity = Double.parseDouble(quantityStr);
        fruits.put(fruitName, quantity);
    } catch (NumberFormatException e) {
        invalidInput = true;
    }
}

public double getTotalQuantity() {
    double total = 0.0;
    for (double value : fruits.values()) {
        total += value;
    }
    return total;
}
}

```

```

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        FruitFestival festival = new FruitFestival();

        while (true) {
            String input = sc.next();
            if (input.equalsIgnoreCase("done")) {
                break;
            }
            festival.addFruit(input);
        }

        if (festival.invalidFormat) {
            System.out.println("Invalid format");
        } else if (festival.invalidInput) {
            System.out.println("Invalid input");
        } else {

```

```
double total = festival.getTotalQuantity();  
DecimalFormat df = new DecimalFormat("0.00");  
System.out.println(df.format(total));  
    }  
}  
}
```

Status : Correct
